- **UI + Logic coupling:** Features requiring both backend logic changes and frontend UI updates
- **Novel implementations:** Tasks requiring architectural patterns not present in existing codebase

Agent Differences.

- **Cursor:** Best at exploratory search, often identifies all relevant files but may not modify all of them
- **Claude Code:** More conservative, produces well-formed patches for files it chooses to modify
- **Codex:** Strong code generation but weaker codebase navigation, relies heavily on initial context
- **OpenCode:** Struggles with large codebases, often gets stuck in endless file reading loops

Implications for Practitioners. For teams considering AI coding agents for production use:

(1) **Structure PRDs carefully:** Explicitly list affected files, reference similar code patterns, provide architectural context
(2) **Start with isolated modules:** Assign agents well-scoped tasks before attempting complex multi-module features
(3) **Human review is critical:** Even "successful" patches may miss edge cases or have incomplete coverage
(4) **Iterative refinement:** Use agent output as first draft, not final implementation
